

What is MYKOS?

MYKOS is a specific super species of Mycorrhizae.

Mycorrhizae is a beneficial, soil-borne, microbe (fungus) that attaches itself to a plant's roots and helps the plant collect more nutrients and moisture like a giant sponge.

MYKOS works fast and creates strong roots in 90% of common plants.

MYKOS "Jump starts" new plantings by reducing transplant shock & by stimulating root growth. **MYKOS** forms a bridge (Hyphae) between roots and the nutrients in the soil. It shields roots from disease attacks and protects against drought. It is also helpful in improving soil structure both in clay soil and sandy soil. Use on fruits, vegetables & flowers!

Use at time of planting by applying to the root ball or sprinkling in the hole or on the furrow when planting seeds (See package for full instructions).

The Bottom Line:

Stronger Plants, Earlier Flowers, Earlier Fruit - Larger Harvest!
